

Network Devices

Explain behaviour of Hub device.

⇒ Hub is a network device.

⇒ If we want send data between devices first we have form network.

⇒ Hub is a network device which will send data to devices in same network.

⇒ If data is sending b/w devices first we need to find destination MAC. Here hub will broadcast for destination MAC. After finding destination MAC, from source sender will send data to hub then hub will send to all devices in the network.

2. Explain behaviour of Switch device.

⇒ Switch is a network device.

⇒ It is a data link layer device.

⇒ Switch is more intelligent than the hub.

→ Switch is used to connect (or) for LAN.

⇒ Switch have ports. All devices are connected to ports. If any 'A' device wants to send data to device 'B' in same network switch will follow MAC table to decrease Congestion in the traffic. After finding MAC destination switch will send data to that particular device 'B' only.

Explain behaviour of Router?

⇒ Router is a network device used to connect between different networks.

⇒ Router will work based on IP. So Router is layer 3 device.

⇒ Router will maintain routing table to forward the traffic b/w networks.

Network Devices

Explain behaviour of Hub device.
